TECHNIQUES AND METHODS

I have developed strong technical expertise with several tools (EEG, psychophysiological signals) and methods. In particular, I employ advanced statistical procedures (Bayesian frameworks, predictive and structural modelling, machine/deep learning and computational modeling) to address the scientific challenges that I encounter. In parallel, I develop open-source software, such as the [easystats](#) collection of R packages; [NeuroKit](#), a Python package for neurophysiological signal processing; [Pyllusion](#), a framework to generate visual illusions; or [Neuropsydia](#), a software to create experiments.

Initially created to increase the efficiency and quality of my own research, some of these tools have become quite popular and are actively used by the scientific community (e.g., the [easystats](#) packages have been downloaded more than 40 million times since their creation, and [NeuroKit](#) has become one of the most popular toolbox for multimodal physiology).

OPEN SCIENCE

My interest in improving accessibility, widening the usage of advanced methods and best practices by means of open access tools and tutorials, and staying active in open-software communities (e.g., on [GitHub](#) by answer technical and methodological questions, is motivated by the fact that, coming myself from a different background (clinical neuropsychology) in which programming, computer science and advanced statistics are not taught, I realized how harnessing such powerful tools can improve one's research (and quality of life) at many levels.

I fully endorse to the highest standards of open science, by sharing data and reproducible scripts of my experiments. Naturally, my concrete engagement in open, honest and reproducible science, is accompanied by the highest standards in terms of methodological rigour and ethical responsibility.
